

**Database Principles:  
Fundamentals of Design,  
Implementation, and  
Management  
Tenth Edition**

*Chapter 12*

*Database Administration and Security*

# Objectives

In this chapter, students will learn:

- That data are a valuable business asset requiring careful management
- How a database plays a critical role in an organization
- That the introduction of a DBMS has important technological, managerial, and cultural consequences for an organization

# Objectives (cont'd.)

- What the database administrator's managerial and technical roles are
- About data security, database security, and the information security framework
- About several database administration tools and strategies
- How various technical tasks of database administration are performed with Oracle

# Data as a Corporate Asset

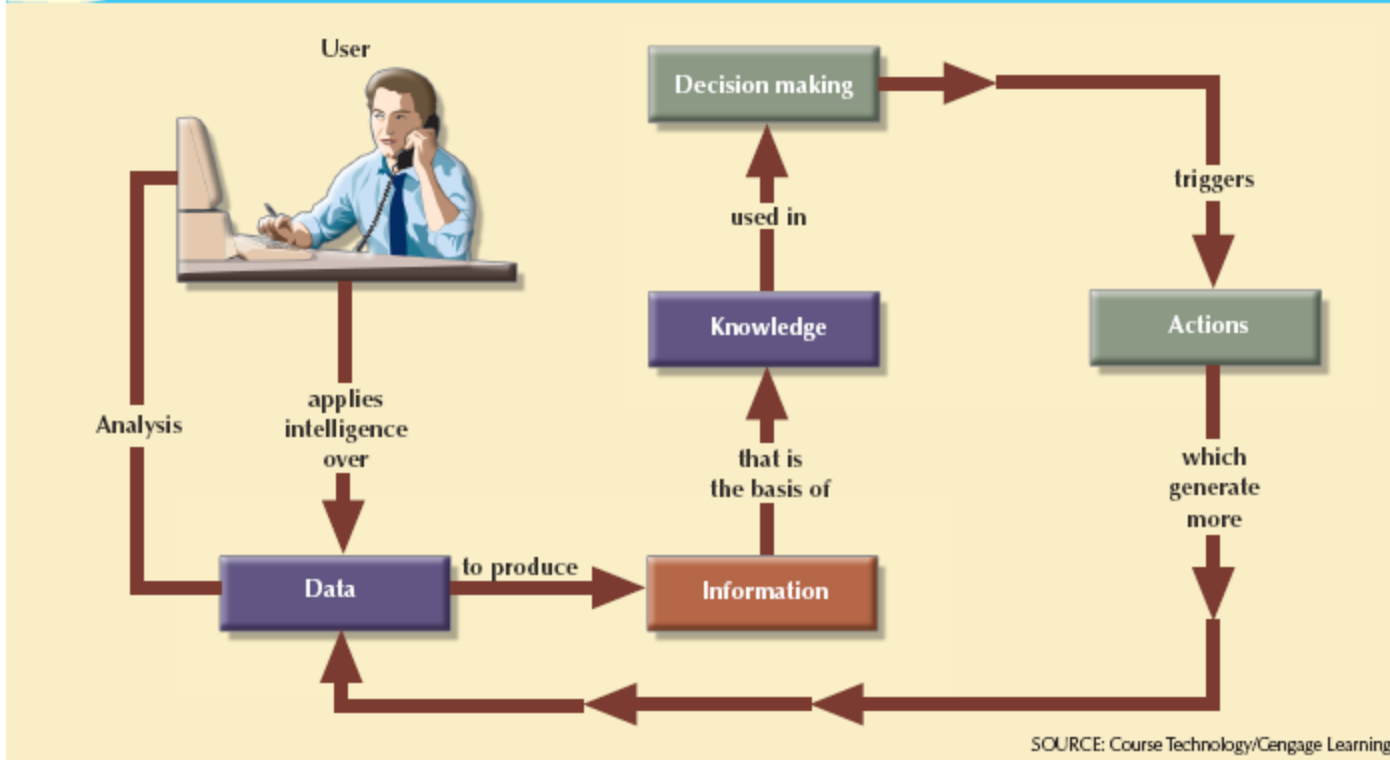

- Data:
  - Valuable asset that requires careful management
  - Valuable resource that translates into information
- Accurate, timely information triggers actions that enhance company's position and generate wealth

# Data as a Corporate Asset (cont'd.)

- Dirty data
  - Data that suffer from inaccuracies and inconsistencies
  - Threat to organizations

**FIGURE 12.1**

**The data-information-decision cycle**

# Data as a Corporate Asset (cont'd.)

- Data quality
  - Comprehensive approach to ensuring the accuracy, validity, and timeliness of the data
- Data profiling software
  - Consists of programs that gather statistics and analyze existing data sources
- Master data management (MDM) software
  - Helps prevent dirty data by coordinating common data across multiple systems.

# The Need for and Role of Databases in an Organization

- Database's predominant role is to support managerial decision making at all levels
- DBMS facilitates:
  - Interpretation and presentation of data
  - Distribution of data and information
  - Preservation and monitoring of data
  - Control over data duplication and use
- Three levels to organization management:
  - Top, middle, operational

# Introduction of a Database: Special Considerations

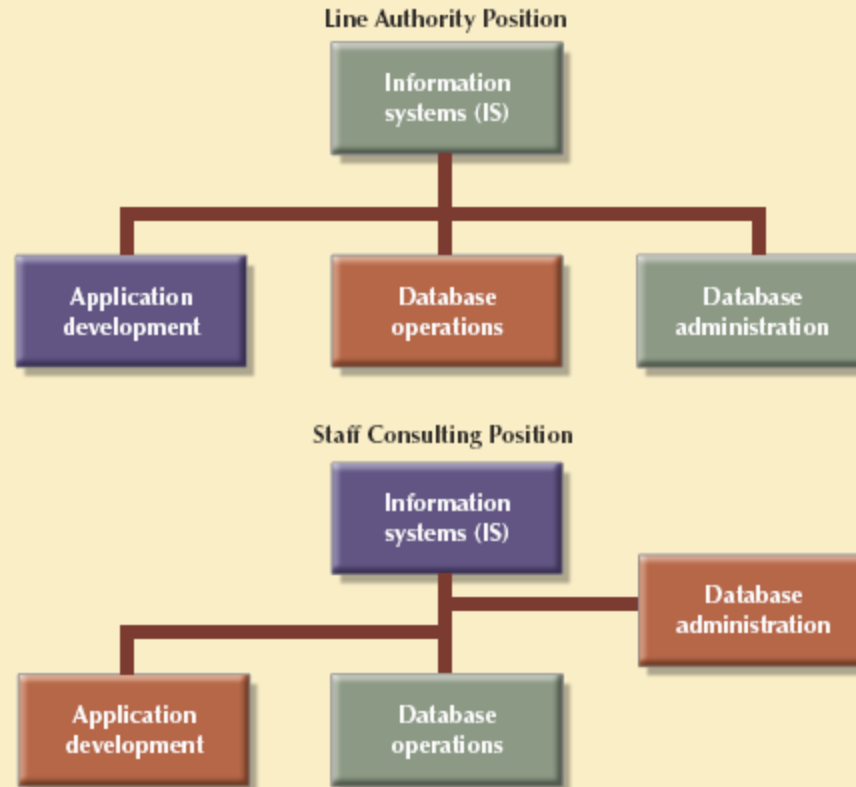

- Introduction of a DBMS is likely to have a profound impact
  - Might be positive or negative, depending on how it is administered
- Three aspects to DBMS introduction:
  - Technological
  - Managerial
  - Cultural
- One role of DBA department is to educate end users about system uses and benefits

# The Evolution of the Database Administration Function

- Data administration has its roots in the old, decentralized world of the file system
- Advent of DBMS produced new level of data management sophistication
  - DP department evolved into information systems (IS) department
- Data management became increasingly complex
  - Development of database administrator (DBA) function

**FIGURE 12.3**

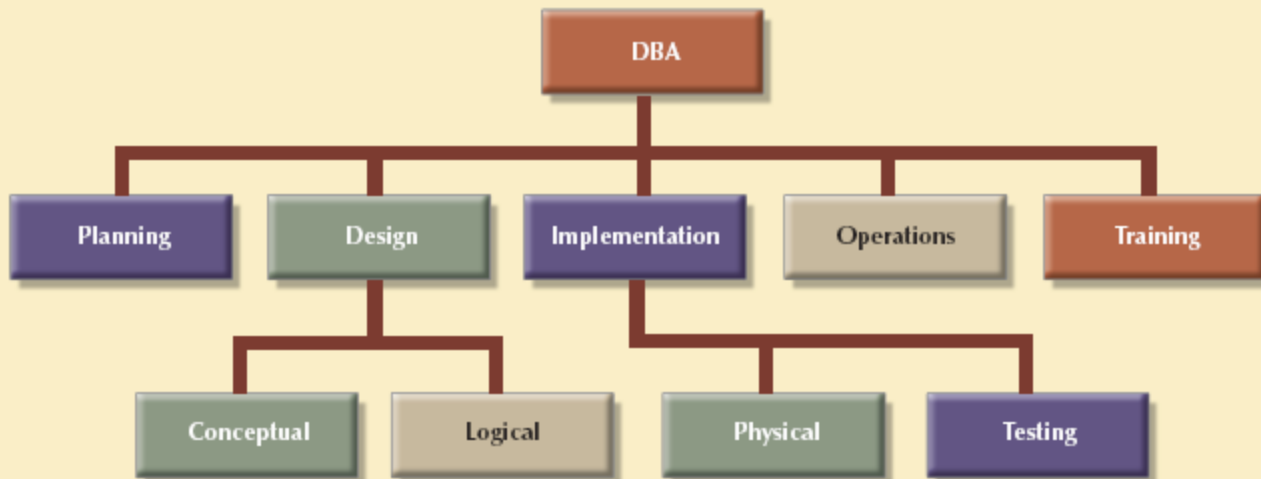

**The placement of the DBA function**

SOURCE: Course Technology/Cengage Learning

**FIGURE 12.4**

**A DBA functional organization**

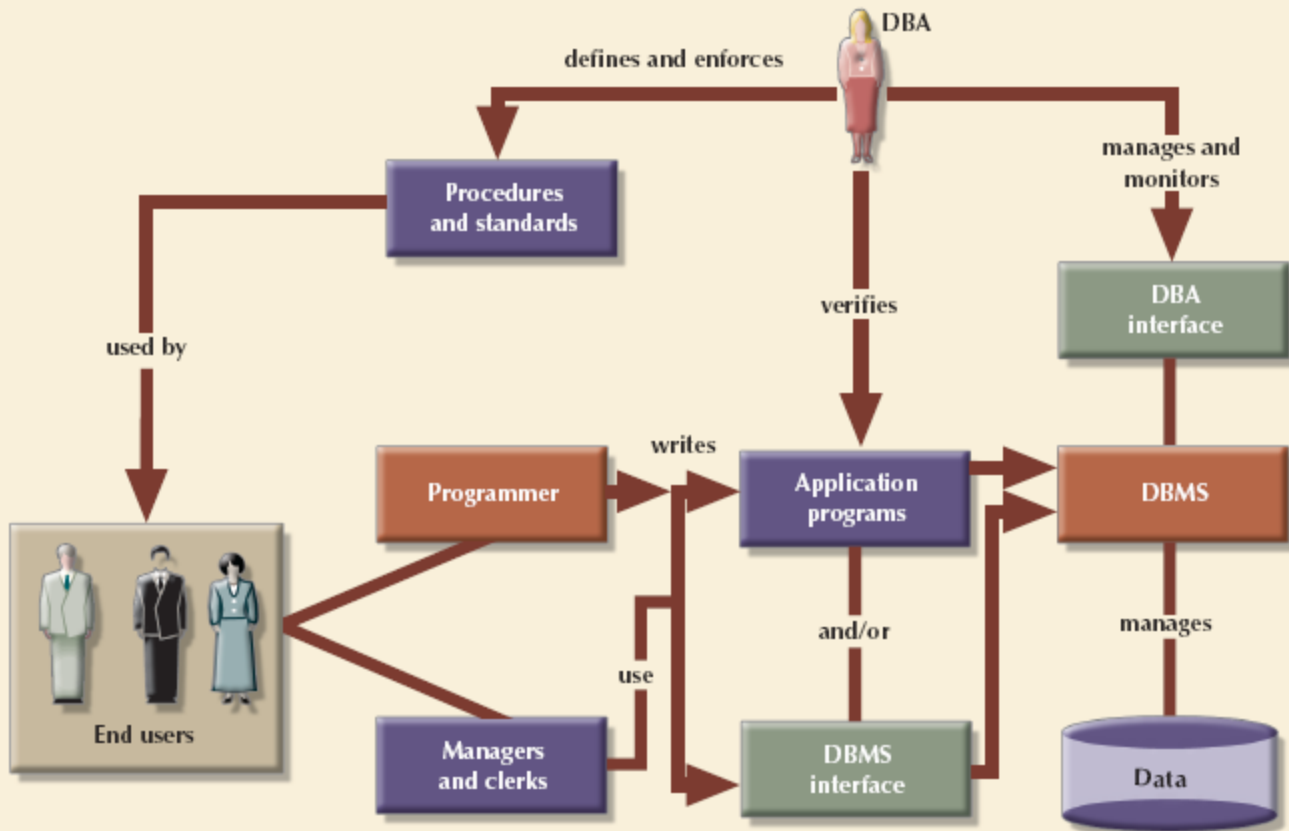

SOURCE: Course Technology/Cengage Learning

# The Database Environment's Human Component

- Even most carefully crafted database system cannot operate without human component
- Effective data administration requires both technical and managerial skills
- DA must set data administration goals
- DBA is focal point for data/user interaction
- Need for diverse mix of skills

**FIGURE 12.6**

**A summary of DBA activities**

SOURCE: Course Technology/Cengage Learning

# The DBA's Managerial Role

- DBA responsible for:
  - Coordinating, monitoring, allocating resources
    - Resources include people and data
  - Defining goals and formulating strategic plans
- Interacts with end user by providing data and information
- Enforces policies, standards, procedures

# The DBA's Managerial Role (cont'd.)

- Manages security, privacy, integrity
- Ensures data can be fully recovered
  - In large organizations, database security officer (DSO) responsible for disaster management
- Ensures data is distributed appropriately
  - Makes it easy for authorized end users to access the database

**TABLE  
12.3**

**DBA Activities and Services**

DBA ACTIVITY	DBA SERVICE
Planning	End-user support
Organizing	Policies, procedures, and standards
Testing	Data security, privacy, and integrity
Monitoring	Data backup and recovery
Delivering	Data distribution and use

# The DBA's Technical Role

- Evaluates, selects, and installs DBMS and related utilities
- Designs and implements databases and applications
- Tests and evaluates databases and applications

# The DBA's Technical Role (cont'd.)

- Operates DBMS, utilities, and applications
- Trains and supports users
- Maintains DBMS, utilities, and applications

# The DBA's Role in the Cloud

- Cloud services provide:
  - DBMS installation and updates
  - Server/network management
  - Backup and recovery operations
- DBA's managerial role is largely unchanged

# Security

- Securing data entails securing overall information system architecture
- Confidentiality: data protected against unauthorized access
- Integrity: keep data consistent and free of errors or anomalies
- Availability: accessibility of data by authorized users for authorized purposes

# Security Policies

- Database security officer secures the system and the data
  - Works with the database administrator
- Security policy: collection of standards, policies, procedures to guarantee security
  - Ensures auditing and compliance
- Security audit process identifies security vulnerabilities
  - Identifies measures to protect the system

# Security Vulnerabilities

- Security vulnerability: weakness in a system component
  - Could allow unauthorized access or cause service disruptions
- Security threat: imminent security violation
  - Could occur at any time
- Security breach yields a database whose integrity is either:
  - Preserved
  - Corrupted

**TABLE  
12.4**

**Sample Security Vulnerabilities and Related Protective Measures**

SYSTEM COMPONENT	SECURITY VULNERABILITY	SECURITY MEASURES
People	<ul style="list-style-type: none"> <li>• The user sets a blank password.</li> <li>• The password is short or includes a birth date.</li> <li>• The user leaves the office door open all the time.</li> <li>• The user leaves payroll information on the screen for long periods of time.</li> </ul>	<ul style="list-style-type: none"> <li>• Enforce complex password policies.</li> <li>• Use multilevel authentication.</li> <li>• Use security screens and screen savers.</li> <li>• Educate users about sensitive data.</li> <li>• Install security cameras.</li> <li>• Use automatic door locks.</li> </ul>
Workstation and servers	<ul style="list-style-type: none"> <li>• The user copies data to a flash drive.</li> <li>• The workstation is used by multiple users.</li> <li>• A power failure crashes the computer.</li> <li>• Unauthorized personnel can use the computer.</li> <li>• Sensitive data are stored on a laptop computer.</li> <li>• Data are lost due to a stolen hard disk or laptop.</li> <li>• A natural disaster occurs.</li> </ul>	<ul style="list-style-type: none"> <li>• Use group policies to restrict the use of flash drives.</li> <li>• Assign user access rights to workstations.</li> <li>• Install uninterrupted power supplies (UPSs).</li> <li>• Add security locks to computers.</li> <li>• Implement a kill switch for stolen laptops.</li> <li>• Create and test data backup and recovery plans.</li> <li>• Insure the system against natural disasters—use co-location strategies.</li> </ul>
Operating system	<ul style="list-style-type: none"> <li>• Buffer overflow attacks</li> <li>• Virus attacks</li> <li>• Root kits and worm attacks</li> <li>• Denial-of-service attacks</li> <li>• Trojan horses</li> <li>• Spyware applications</li> <li>• Password crackers</li> </ul>	<ul style="list-style-type: none"> <li>• Apply OS security patches and updates.</li> <li>• Apply application server patches.</li> <li>• Install antivirus and antispymware software.</li> <li>• Enforce audit trails on the computers.</li> <li>• Perform periodic system backups.</li> <li>• Install only authorized applications.</li> <li>• Use group policies to prevent unauthorized installations.</li> </ul>

Applications	<ul style="list-style-type: none"> <li>• Application bugs—buffer overflow</li> <li>• SQL injection, session hijacking, etc.</li> <li>• Application vulnerabilities—cross-site scripting, nonvalidated inputs</li> <li>• E-mail attacks—spamming, phishing, etc.</li> <li>• Social engineering e-mails</li> </ul>	<ul style="list-style-type: none"> <li>• Test application programs extensively.</li> <li>• Build safeguards into code.</li> <li>• Do extensive vulnerability testing in applications.</li> <li>• Install spam filters and antivirus software for e-mail systems.</li> <li>• Use secure coding techniques (see <a href="http://www.owasp.org">www.owasp.org</a>).</li> <li>• Educate users about social engineering attacks.</li> </ul>
Network	<ul style="list-style-type: none"> <li>• IP spoofing</li> <li>• Packet sniffers</li> <li>• Hacker attacks</li> <li>• Clear passwords on network</li> </ul>	<ul style="list-style-type: none"> <li>• Install firewalls.</li> <li>• Use virtual private networks (VPNs).</li> <li>• Use intrusion detection systems (IDSs).</li> <li>• Use network access control (NAC).</li> <li>• Use network activity monitoring.</li> </ul>
Data	<ul style="list-style-type: none"> <li>• Data shares are open to all users.</li> <li>• Data can be accessed remotely.</li> <li>• Data can be deleted from a shared resource.</li> </ul>	<ul style="list-style-type: none"> <li>• Implement file system security.</li> <li>• Implement share access security.</li> <li>• Use access permission.</li> <li>• Encrypt data at the file system or database level.</li> </ul>

# Database Security

- Refers to the use of DBMS features and other measures to comply with security requirements
- DBA secures DBMS from installation through operation and maintenance
- Authorization management
  - User access management
  - View definition
  - DBMS access control
  - DBMS usage monitoring

# Database Administration Tools

- Data dictionary
- CASE tools

# The Data Dictionary

- Two main types of data dictionaries:
  - Integrated
  - Standalone
- Active data dictionary is automatically updated by the DBMS with every database access
- Passive data dictionary requires running a batch process
- Main function: store description of all objects that interact with database

# The Data Dictionary (cont'd.)

- Data dictionary that includes data external to DBMS becomes flexible tool
  - Enables use and allocation of all of an organization's information
- Metadata is often the basis for monitoring database use
  - Also for assigning access rights to users
- DBA uses data dictionary to support data analysis and design

# CASE Tools

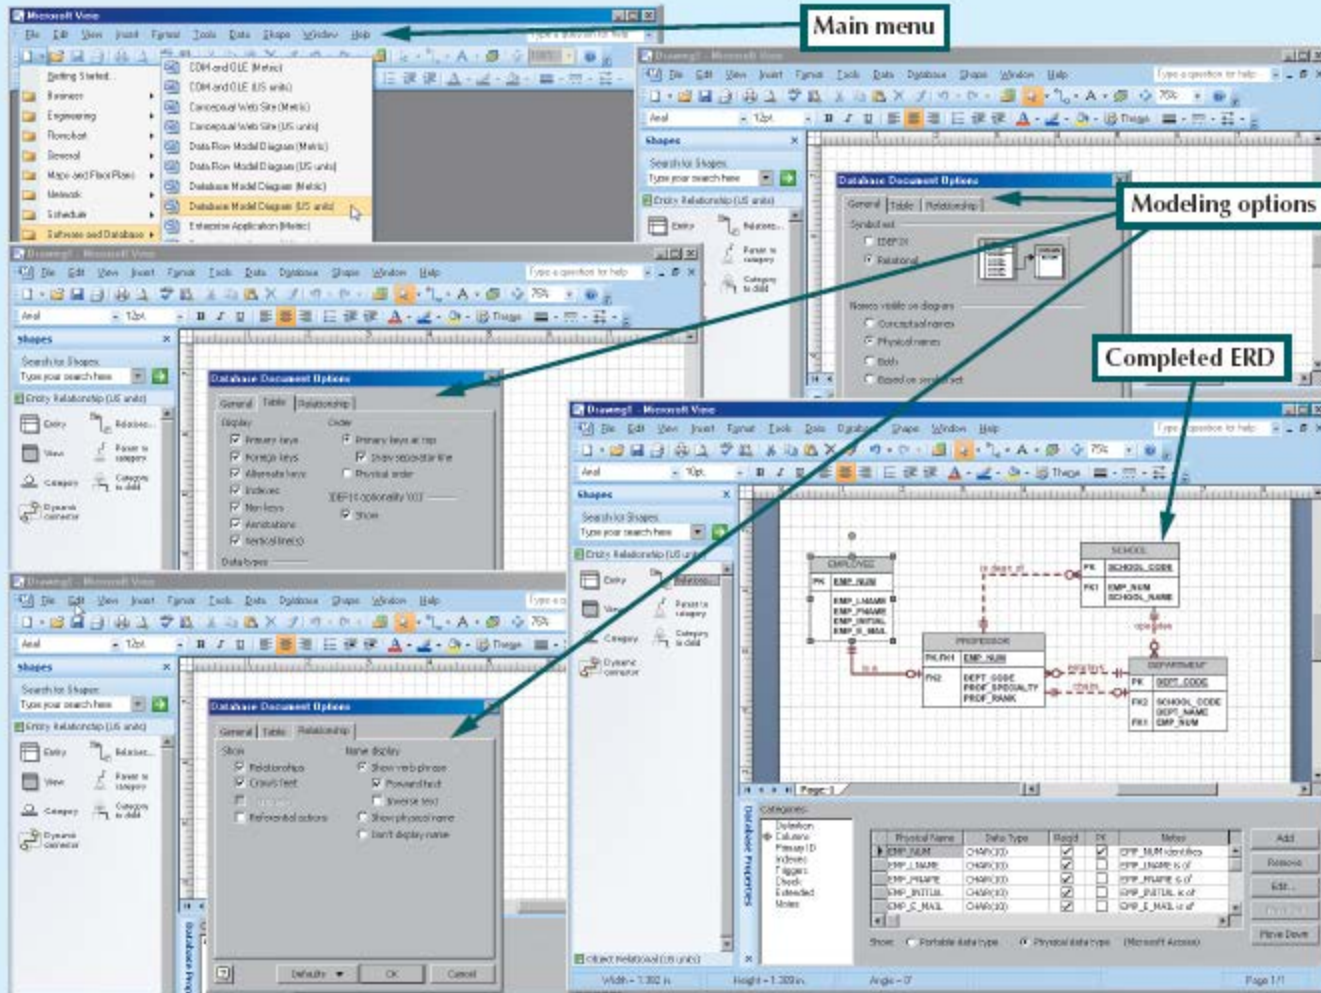

- Computer-aided systems engineering
  - Automated framework for SDLC
  - Structured methodologies and powerful graphical interfaces
- Front-end CASE tools provide support for planning, analysis, and design phases
- Back-end CASE tools provide support for coding and implementation phases

# CASE Tools (cont'd.)

- Typical CASE tool has five components
  - Graphics for diagrams
  - Screen painters and report generators
  - Integrated repository
  - Analysis segment
  - Program documentation generator

**FIGURE 12.7**

**An example of a CASE tool: Visio Professional**

SOURCE: Course Technology/Cengage Learning

# Developing a Data Administration Strategy

- Information engineering (IE) translates strategic goals into data and applications
- Information systems architecture (ISA) is the output of IE process
- Implementing IE is a costly process
  - Provides a framework that includes use of computerized, automated, and integrated tools
- Success of information systems strategy depends on critical success factors
  - Managerial, technological, and corporate culture

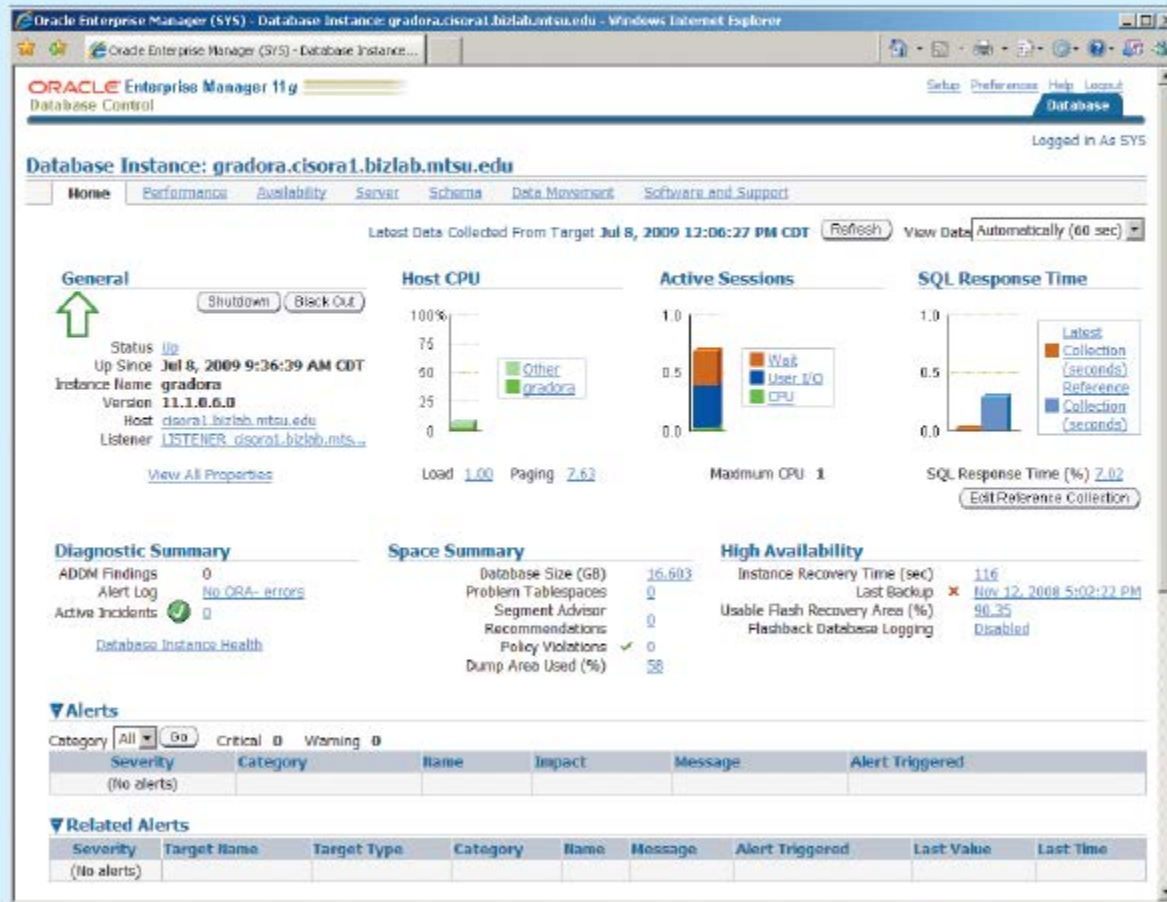

# The DBA at Work: Using Oracle for Database Administration

- Technical tasks handled by the DBA in a specific DBMS:
  - Creating and expanding database storage structures
  - Managing database objects
  - Managing end-user database environment
  - Customizing database initialization parameters
- All DBMS vendors provide programs to perform database administrative tasks

# Oracle Database Administration Tools

FIGURE 12.9

The Oracle Enterprise Manager interface

SOURCE: Course Technology/Cengage Learning

# The Default Login

- Must connect to the database to perform administrative tasks
  - Username with administrative privileges
- Oracle automatically creates SYSTEM and SYS user IDs with administrative privileges
- Define preferred credentials by clicking on Preferences link, then Preferred Credentials
- Username and passwords are database-specific

# Ensuring that the RDBMS Starts Automatically

- DBA ensures database access is automatically started when computer turned on
- A service is a Windows system name for a special program that runs automatically
  - Part of the operating system
- Database instance: separate location in memory reserved to run the database
  - May have several databases running in memory at the same time

# Creating Tablespaces and Datafiles

- Database composed of one or more tablespaces
- Tablespace is a logical storage space
  - Physically stored in one or more datafiles
- Datafile physically stores the database's data
  - Each datafile can reside in a different directory on the hard disk
- Database has 1:M relationship with tablespaces
- Tablespace has 1:M relationship with datafiles

**FIGURE 12.12**

**The Oracle Storage Manager**

Oracle Enterprise Manager 11g  
Database Control  
Database Instance: gradora.cisora1.birdlab.mtsu.edu > Logged in As SYS

Object Type: Tablespace

Search  
Enter an object name to filter the data that is displayed in your results set.  
Object Name:   
Go

By default, the search returns all uppercase matches beginning with the string you entered. To run an exact or case-sensitive match, double quote the search string. You can use the wildcard symbol (%) in a double quoted string.

Selection Mode: Single Create

Select	Name	Allocated Size (MB)	Space Used (MB)	Allocated Space Used (%)	Allocated Free Space (MB)	Status	Datafiles	Type	Extent Management	Segment Management
<input checked="" type="checkbox"/>	SYSAUX	899.4	852.9	94.8	46.4	✓	1	PERMANENT LOCAL	AUTO	
<input type="checkbox"/>	SYSTEM	710.0	703.9	99.1	6.1	✓	1	PERMANENT LOCAL	MANUAL	
<input type="checkbox"/>	TEMP	3,845.0	0.0	0.0	3,845.0	✓	1	TEMPORARY LOCAL	MANUAL	
<input type="checkbox"/>	UNDOTBS1	6,510.0	18.2	0.3	6,491.8	✓	1	UNDO LOCAL	MANUAL	
<input type="checkbox"/>	USERS	5,037.2	4,710.3	93.5	326.9	✓	1	PERMANENT LOCAL	AUTO	

Total Allocated Size (MB) 17,801.6  
Total Used (MB) 6,285.3  
Total Allocated Free Space (MB) 10,716.2

## Creating a new tablespace

SOURCE: Course Technology/Cengage Learning

# Managing the Database Objects: Tables, Views, Triggers, and Procedures

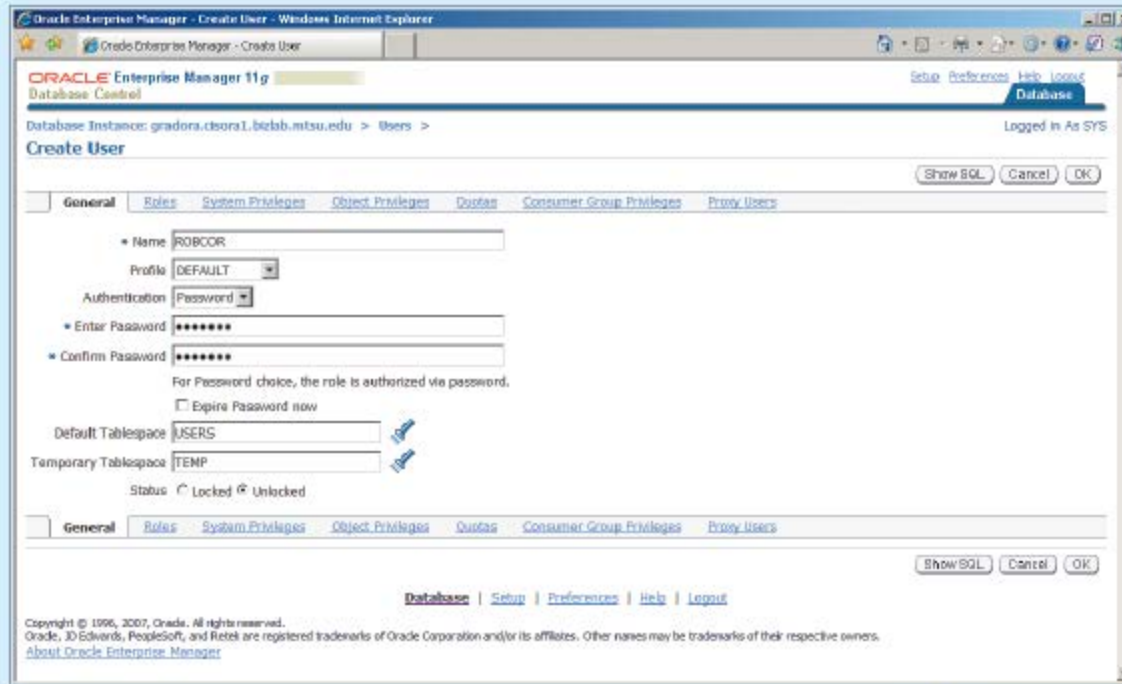

- Database object: any object created by end users
- Schema: logical section of the database that belongs to a given user
  - Schema identified by a username
  - Within the schema, users create their own tables and other objects
- Normally, users are authorized to access only the objects that belong to their own schemas

# Managing Users and Establishing Security

- User: uniquely identifiable object
  - Allows a given person to log on to the database
- Role: a named collection of database access privileges
  - Authorizes a user to connect to the database and use system resources
- Profile: named collection of settings
  - Controls how much of a resource a given user can use

FIGURE

# Customizing the Database Initialization Parameters

- Fine-tuning requires modification of database configuration parameters
  - Some are changed in real time using SQL
  - Some affect database instance
  - Others affect entire RDBMS and all instances
- Initialization parameters reserve resources used by the database at run time
- After modifying parameters, may need to restart the database

**FIGURE 12.17**

**The Oracle Enterprise Manager initialization parameters**

The screenshot displays the Oracle Enterprise Manager 11g 'Initialization Parameters' page. The interface includes a breadcrumb trail, a 'Database' tab, and a 'Current' parameter set. A note states: 'The parameter values listed here are currently used by the running instance(s). You can change static parameters in SPFile mode.' Below this, there are filters for 'Basic', 'Modified', and 'Dynamic' categories, and a 'Go' button. A checkbox option is present: 'Apply changes in current running instance(s) mode to SPFile. For static parameters, you must restart the database.' A 'Save to File' button is also visible. The main content is a table with the following columns: Name, Help, Revisions, Value, Comments, Type, Basic, Modified, Dynamic, and Category. The table lists 19 parameters with their respective values and settings.

Name	Help	Revisions	Value	Comments	Type	Basic	Modified	Dynamic	Category
audit_file_dest	(H)		C:\ORACLE\SMORRIS\ADMIN		String	✓		✓	Se

# Summary

- Data management is a critical activity for any organization
  - Data should be treated as a corporate asset
- DBMS is the most commonly used electronic tool for corporate data management
- DBMS has impact on organization's managerial, technological, and cultural framework
- Data administration function evolved from centralized electronic data processing

# Summary (cont'd.)

- Database administrator (DBA) is responsible for managing corporate database
- Broader data management activity is handled by data administrator (DA)
- DA is more managerially oriented than more technically oriented DBA
  - DA function is DBMS-independent
  - DBA function is more DBMS-dependent
- When there is no DA, DBA executes all DA functions

# Summary (cont'd.)

- Managerial services of DBA function:
  - Supporting end-user community
  - Defining and enforcing policies, procedures, and standards for database function
  - Ensuring data security, privacy, and integrity
  - Providing data backup and recovery services
  - Monitoring distribution and use of data in database

# Summary (cont'd.)

- Technical role of DBA:
  - Evaluating, selecting, and installing DBMS
  - Designing and implementing databases and applications
  - Testing and evaluating databases and applications
  - Operating DBMS, utilities, and applications
  - Training and supporting users
  - Maintaining DBMS, utilities, and applications

# Summary (cont'd.)

- Security: ensures confidentiality, integrity, availability of information system and data
- Security policy: collection of standards, policies, and practices
- Security vulnerability: weakness in system component
- Information engineering guides development of data administration strategy
- CASE tools and data dictionaries translate strategic plans to operational plans
