CHAPTER 6 OUTLINE

- 6.1 The Technology of Production
- 6.2 Production with One Variable Input (Labor)
- 6.3 Production with Two Variable Inputs
- 6.4 Returns to Scale

Chapter 6: Production

2 of 24

Production

The **theory of the firm** describes how a firm makes cost-minimizing production decisions and how the firm's resulting cost varies with its output.

The Production Decisions of a Firm

The production decisions of firms are analogous to the purchasing decisions of consumers, and can likewise be understood in three steps:

1. Production Technology
2. Cost Constraints
3. Input Choices

6.2 PRODUCTION WITH ONE VARIABLE INPUT (LABOR)

Labor Productivity

- **labor productivity** Average product of labor for an entire industry or for the economy as a whole.

Productivity and the Standard of Living

- **stock of capital** Total amount of capital available for use in production.
- **technological change** Development of new technologies allowing factors of production to be used more effectively.

6.2 PRODUCTION WITH ONE VARIABLE INPUT (LABOR)

EXAMPLE 6.2 Labor Productivity and the Standard of Living

TABLE 6.3 Labor Productivity in Developed Countries

	UNITED STATES	JAPAN	FRANCE	GERMANY	UNITED KINGDOM
Real Output per Employed Person (2006)					
	\$82,158	\$57,721	\$72,949	\$60,692	\$65,224
Annual Rate of Growth of Labor Productivity (%)					
Years					
1960-1973	2.29	7.86	4.70	3.98	2.84
1974-1982	0.22	2.29	1.73	2.28	1.53
1983-1991	1.54	2.64	1.50	2.07	1.57
1992-2000	1.94	1.08	1.40	1.64	2.22
2001-2006	1.78	1.73	1.02	1.10	1.47

The level of output per employed person in the United States in 2006 was higher than in other industrial countries. But, until the 1990s, productivity in the United States grew on average less rapidly than productivity in most other developed nations. Also, productivity growth during 1974–2006 was much lower in all developed countries than it had been in the past.

6.3 PRODUCTION WITH TWO VARIABLE INPUTS

Isoquants

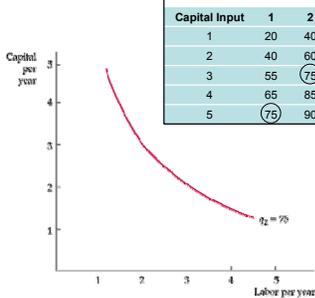

TABLE 6.4 Production with Two Variable Inputs

Capital Input	LABOR INPUT				
	1	2	3	4	5
1	20	40	55	65	75
2	40	60	75	85	90
3	55	75	90	100	105
4	65	85	100	110	115
5	75	90	105	115	120

- **isoquant** Curve showing all possible combinations of inputs that yield the same output.

6.4 RETURNS TO SCALE

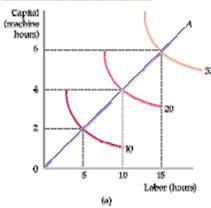

- **returns to scale** Rate at which output increases as inputs are increased proportionately.
- **increasing returns to scale** Situation in which output more than doubles when all inputs are doubled.
- **constant returns to scale** Situation in which output doubles when all inputs are doubled.
- **decreasing returns to scale** Situation in which output less than doubles when all inputs are doubled.

6.4 RETURNS TO SCALE

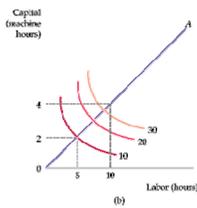

Describing Returns to Scale

Figure 6.9

Returns to Scale

When a firm's production process exhibits constant returns to scale as shown by a movement along line OA in part (a), the isoquants are equally spaced as output increases proportionally.

However, when there are increasing returns to scale as shown in (b), the isoquants move closer together as inputs are increased along the line.

6.4 RETURNS TO SCALE

EXAMPLE 6.4 Returns to Scale in the Carpet Industry

Over time, the major carpet manufacturers have increased the scale of their operations by putting larger and more efficient tufting machines into larger plants. At the same time, the use of labor in these plants has also increased significantly. The result? Proportional increases in inputs have resulted in a more than proportional increase in output for these larger plants.

TABLE 6.5 The U.S. Carpet Industry	
Carpet Sales, 2005 (Millions of Dollars per Year)	
1. Shaw	4346
2. Mohawk	3779
3. Beaulieu	1115
4. Interface	421
5. Royalty	298
